

What is comment in java?

Comments are used to enhance the **readability** of the code. It is ignored by the Compiler.

In java, we have 3 types of comments

- 1) Single line Comment
//
- 2) Multiline Comment
/*

*/
- 3) Documentation comment
/**
Name of the Project: Online Shopping
Number of Modules: 70 Modules
Project Date: 12th March 2024
Last Modification: 24th Jun 2026
Author: James Gosling and his friends
*/

Naming convention OR Coding standard in java:

Naming convention provides two important characteristics:

- a) Standard Code (Industry accepted code)
- b) Readability of the code will enhance.

1) How to write a class in java:

While writing a class in java, we should follow **pascal naming convention**, according to this each word, first character must be **capital** and it should not contain any space. In java a class represents **noun**.

Example :
ThisIsExampleOfClass

System
String
Integer
CommandAddition
ArrayIndexOutOfBoundsException
DataInputStream.
IO
Scanner

2) How to write a method in java:

While writing a method in java we should follow **camel case naming convention**, According to this naming convention first word will be **in small** and 2nd word onwards, each word first character must be capital. In java a method represents **verb**.

Example :
thisIsExampleOfMethod()
read()
readLine()
parseInt()
charAt()
toUpperCase()

3) How to write a Variable/Field in java:

While writing a variable/field we should follow **camel case naming convention** but unlike method variable does not have **() symbol**.

Example :
rollNumber
customerName
customerBill
studentName
playerName

4) How to write a final and static field:

While writing the final and static field we should follow **snake_case naming convention**. Each character must be capital and in between two words we must have **_** symbol.

Example of Byte class:
SIZE = 8 [SIZE is final and static field]
MIN_VALUE = -128 [MIN_VALUE is final and static field]
MAX_VALUE = 127 [MAX_VALUE is final and static field]

5) How to write a package :

A package must be written in lower case only. Generally, it is reverse of company name.

com.nit.basic
com.tcs.chating
com.wipro.online_shopping

WAP in java to display a welcome message :

Description of main() method :

- void :**
 - * It is a keyword in java.
 - * We should use void before the user-defined method name, if we don't want to return any type of value from that particular method.

* In JDK 25V main method return type must be void, as a programmer we cannot return any type of value from this main method otherwise compilation error will be generated.

Example :
int main() //Invalid
{
return 0;;
}

Basic types of method in Java :

As of now, In Java we have 2 types of methods :

- a) Static Method (Object **is not** required)
- b) Non Static Method (Object **is** required)

Static Method :

If we declare a method with **static modifier** OR static keyword then It is called static method. In order to call and execute the static method we need not to create an object, We can directly call with class name.

Example :
class Student
{
public static void greet() //static method
{
}
}

Student.greet(); //Calling static metod

Non Static Method :

If we declare a method **without static modifier** then It is called non static method. In order to call non static method, Object is required.

Example :
class Student
{
public void greet() //Non static method
{
}
}

Student s1 = new Student();
s1.greet();
